Tencia Connect – Overview

Tencia Connect can be regarded as the gateway for data import and export and is the tool for other applications to integrate with Tencia. It is designed to facilitate and streamline the exchange of data between applications. Tencia Connect is the mechanism used within the Tencia application to allow data exchange, it facilitates and controls integration with third party applications, ensuring data integrity and database security is maintained.

The Tencia Connect user interface is the mechanism that exposes services such as .Net assemblies, Web services and Windows Communications Foundation, or upload and download routines.

Tencia Connect – Core Functionality

Tencia Connect is available in two parts, Connect Core functionality is included in the core Tencia system, providing a user driven integration process, where the upload\download process is defined, incorporated within the Tencia menu structure and then run from the menu option.

Tencia Connect Enterprise – Specialist Module

Connect Enterprise is a specialist module, which incorporates greater flexibility when importing/exporting data, processes can be scheduled to run automatically and other data exchange methods can be configured including: User Interface, Connect Service, .Net API or Com Interoperability.

Connect Enterprise service processes can be used to schedule and automate Tencia Connect process definitions for a selected server code. A selected process can be scheduled based on frequency of Days, Hours, Minutes and Seconds, priorities can also be allocated to each service process.
